

CHOOSING TWEHA® MEANS CHOOSING FOR THE ENVIRONMENT

Sustainability is no longer an option in modern construction — it is a responsibility. At TWEHA®, environmental awareness plays a central role in the development of our bonding technologies and product solutions. We continuously strive to reduce the use of environmentally harmful substances while maintaining the highest standards in performance, safety, and durability. Because building for the future also means protecting the future.

Sustainability Is a Core Value at TWEHA®

At TWEHA®, sustainability is not simply a marketing statement — it is an active policy integrated into our product development and decision-making processes.

Our objective is clear:

- reduce harmful emissions,
- minimize environmentally damaging substances,
- improve workplace safety,
- and contribute to a healthier environment for future generations.

This commitment influences the materials and technologies we choose for our adhesive systems and surface treatments.

Why We Chose a Different Path

A good example is our water-based surface conditioner.

Many comparable products available on the market contain extremely high levels of: **toluene**.

In some cases, these products consist of approximately: **90% toluene-based solvents**.

Toluene is widely known as:

- a component in thinner,
- an ingredient in petrol,
- a solvent in repair adhesives,
- and a chemical associated with significant health risks.

Long-term exposure to high concentrations of toluene may contribute to:

- memory problems,
- neurological effects,
- and other health-related issues.

In addition, short-term exposure can also be harmful to users and installers.

A Conscious Decision for Safer Alternatives

For that reason, TWEHA® consciously decided not to include highly toluene-based products in our product range.

Even though alternative water-based technologies can sometimes be:

- more difficult to process,
- technically more demanding,
- or less commercially convenient,

We believe responsible product choices are more important than choosing the easiest route. At TWEHA®, product quality should never come at the expense of:

- human health,
- installer safety,
- or environmental responsibility.

Reducing Harmful Substances in Bonding Products

TWEHA® also actively works on minimizing or eliminating environmentally critical substances in our adhesive systems wherever technically possible.

Our commitment to environmental responsibility includes continuous focus on:

- cleaner formulations,
- reduced emissions,
- safer processing,
- and sustainable product development.

This allows professionals to work with high-performance bonding systems while contributing to safer and more sustainable construction practices.

Sustainability and Performance Can Go Together

Choosing environmentally responsible products should never mean compromising on quality or durability.

TWEHA® bonding systems continue to deliver:

- reliable adhesion,
- long-term façade performance,
- structural safety,
- and professional installation quality

while supporting modern environmental standards and sustainable building practices.

Building Responsibly for Future Generations

At TWEHA®, we believe sustainability is about more than today's projects.

It is about creating solutions that contribute to:

- a healthier environment,
- safer workplaces,
- sustainable construction,
- and a better future for the next generation.

Because the choices we make today affect not only ourselves — but also our children and the world they will inherit.

Choosing TWEHA® as your bonding partner therefore means choosing:

- quality,
- reliability,
- innovation,
- and environmental responsibility.
